SwiftZone

SwiftZone®

Absorbent pads with our exclusive structure allowing absorption, diffusion* and rapid retention of urine which keeps away skin humidity and minimises the risk of leaks.

Protection and safety for your incontinent patients.

system SwiftZone

AZ: reinforced barrier system

Zonal absorption in the upper layer: absorbent in the centre, which drives the urine to the interior of the absorbent it is hydrophobic on the sides, repelling urine and promoting the effectiveness of 100% water-resistant anti-leak barriers.

HL: layer acquisition-diffusion*

Textile fibres which instantly promote the passage of urine and its diffusion inside the absorbent pad: reduces waterlogging and minimises humidity return.

N1: first absorption layer

Superabsorbent upper core: fosters absorption and effective retention of urine, preventing humidity from coming into contact with the skin.

N2: second absorption layer

Superabsorbent lower core: with a greater concentration of cellulose and SAP in the central area, ensures high absorption and retention where it is needed most.
